

M039- KAWASAKI MARINE KEY PROGRAMMING TOOL

①Development Background

M039 is designed for adding or reprogramming keys for a KAWASAKI personal watercraft(PWC). It can finish key programming without help of other devices.

②Key Types

It allows up to six keys for a KAWASAKI water runner. There are two types keys:

FPO Key (Orange) 27008-3767

SLO Key (Yellow) 27008-3768.

③Steps For Programming A New Key

If you program a key, all the other keys programmed need to be programmed again except for the original key, up to six keys for a water runner, not supporting all keys lost. If you don't have any original keys or its duplicates, then the ECU must be replaced.

Step 1-Find corresponding remote connector

There are two types connectors, pls find corresponding remote connector.

Step 2-Connect connector with M039

Connect connector with M039, a cable of key programming for KAWASAKI ski.

Step 3-Start key Programming of ECU

Insert an original key(an FPO or an SLO key are both ok) into your watercraft and press it in

around a second. If the buzzer beeps twice shortly and once long, then key programming is on.

Step 4-Program a new key

Take out the original key and insert a new key to be programmed and press it in around a second.

If the buzzer beeps twice shortly, it shows key programming successful.

Remarks: if you'd like to program more new keys, pls repeat steps above. Beeps will increase by times(for example, three beeps for the third key, four beeps for the fourth one). It allows 6 keys programmed at most.

Step 5-Save programming data into ignition system of ECU

However, even the last key has been programmed, it' s not the end. Pls keep it on and press it again until a long beep, at least three seconds. Then all keys have been programmed successfully.

Otherwise it fails to program all keys but pls don' t worry the original key still works well.

After finishing key programming, pls let everything goes back to the way.
